Daryl's Dry Blood sample

NUTRITIONAL MICROSCOPY

The New Biology states:

“There is only one sickness and one disease. The over-acidification of the body is due to an inverted way of living, eating and thinking.”

This over-acidification leads to overgrowth in the body of microorganisms, whose poisons produce the symptoms we call

“disease”

There is only one treatment - “Break the Cycle of Imbalance and Alkalize and Energize.”

“The body is Alkaline by design and Acidic by function”

What is Nutritional Microscopy

It is the art and science of studying the blood in a qualitative manner, versus a standard laboratory quantitative blood test, using a high powered microscope. A single drop of blood is taken from the finger tip using a disposable sterile lancet. The blood is then viewed through the microscope in two ways. The first is the live blood examination on a video monitor showing the quality of the red and white blood cells and plasma. The second is a dry clot test, pin pointing where the acid imbalances are in the body. Through these observation processes, it is possible to see the impact of diet and lifestyle choices at the cellular level.

Microscopy is not a diagnosis, nor is it a replacement for any medical treatment. It is an evaluation for the purpose of guiding an individual in a healthier direction. It is used to create an understanding of acid-alkaline imbalance, and to devise a personal

strategy of using nutritious and naturally grown foods, alkaline water, proper exercise and other alkalizing methods of rebalancing and maintaining good health.

Characteristics observed in the blood test include:

1. The relative activity of white and red blood cells
2. General organ stress
3. The Presence of parasites, bacteria, yeast, fungus and mould.
4. Blood sugar imbalance
5. Malabsorption of fats, proteins and other nutrients.
6. Crystalline forms of morbid matter, acids, cholesterol and Mycotoxin.

Daryl has trained with Dr. Robert O. Young for the last year and has the benefit of working closely with Dr. Young through the PH Miracle Center. A session to evaluate your blood takes about an hour and a half. During the session you will have the opportunity to view your blood and discuss your health concerns. You will be given nutritional suggestions based on your individual profile. A microscopy session is a great way to access where you need to make adjustments to your diet.

We are located in 330 W. Felicita Ave., Escondido, California, 92025.
